

Use the **VUR Index** to Help Inform Your Patient's VUR Management Plan

The Vesicoureteral Reflux Index (VURx) can predict primary VUR improvement or resolution in children.^{1,2,3}

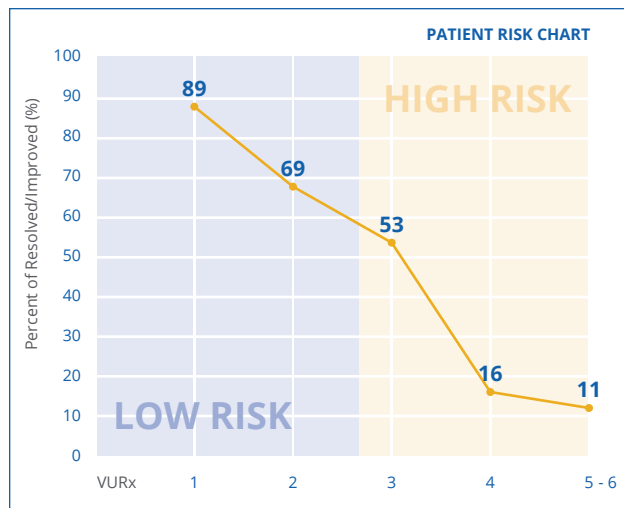

While VUR grade plays an important role in assessing the severity of the VUR, the VURx accounts for other important factors which can help you determine the best management plan for your patient.

VURx is more predictive of breakthrough UTIs than international reflux grade alone.⁴

Use the VURx scoring chart to the right to calculate the probability of spontaneous resolution and the risk of future or recurrent fUTI, referenced in the charts below.

VUCG DATA	SCORE
Timing of Reflux	<input type="text"/>
3 Filling (Early-Mid)	+
2 Filling (Late)	
1 Voiding (Only)	
Ureteral Anomalies (Duplex/PUD)	<input type="text"/>
1 Present	+
0 Absent	
VUR Grade	<input type="text"/>
1 High (4-5)	+
0 Low-Mod (1-3)	
Gender	<input type="text"/>
1 Female	↓
0 Male	
TOTAL	<input type="text"/> out of 6

Probability of spontaneous resolution*

*Within 2 years for children under 2 years of age.¹ Resolution less likely as VURx score and time from diagnosis increase for children over 2 years of age. Resolution is defined as no VUR or 2 or more grade improvement.³
